

## Understanding the Program

### Step 1: Understanding the Program

The program takes the name of a function as input and executes the function corresponding to the name you provided.

```

==> (base) dd@dd-spr:~/Desktop/ctfmid/reverse_eg/packer1$ python3 picker-I.py
Try entering "getRandomNumber" without the double quotes...
==> getRandomNumber
4
Try entering "getRandomNumber" without the double quotes...
==> 

```

### Step 2: Key Observation

There are some extra, confusing, or unnecessary parts in the program (referred to as "crazy stuff"), but they don't matter for solving the challenge.

```

14 def esoteric1():
15     esoteric = \
16     '''
17     int query_apm_bios(void)
18     {
19         struct biosregs ireg, oreg;
20
21         /* APM BIOS installation check */
22         initregs(&ireg);
23         ireg.ah = 0x53;
24         intcall(0x15, &ireg, &oreg);
25
26         if (oreg.flags & X86_EFLAGS_CF)
27             return -1;          /* No APM BIOS */
28
29         if (oreg.bx != 0x504d)   /* "PM" signature */
30             return -1;
31
32         if (!(oreg.cx & 0x02))   /* 32 bits supported? */
33             return -1;
34
35         /* Disconnect first, just in case */
36         ireg.al = 0x04;
37         intcall(0x15, &ireg, NULL);
38
39         /* 32-bit connect */
40         ireg.al = 0x03;
41         intcall(0x15, &ireg, &oreg);
42

```

### Step 3: Solution

Type `win` as the function name when prompted. The program will execute the `win` function, which contains the logic to give you the flag.

```

14 def esoteric1():
15     esoteric = \
16     '''
17     int query_apm_bios(void)
18     {
19         struct biosregs ireg, oreg;
20
21         /* APM BIOS installation check */
22         initregs(&ireg);
23         ireg.ah = 0x53;
24         intcall(0x15, &ireg, &oreg);
25
26         if (oreg.flags & X86_EFLAGS_CF)
27             return -1;          /* No APM BIOS */
28
29         if (oreg.bx != 0x504d)   /* "PM" signature */
30             return -1;
31
32         if (!(oreg.cx & 0x02))   /* 32 bits supported? */
33             return -1;
34
35         /* Disconnect first, just in case */
36         ireg.al = 0x04;
37         intcall(0x15, &ireg, NULL);
38
39         /* 32-bit connect */
40         ireg.al = 0x03;
41         intcall(0x15, &ireg, &oreg);
42

```
